W celu kompilacji odpowiednich podpunktów należy postępować następująco:

• make zad1 kompiluje zadanie 1 (klienta oraz serwer)

Testowanie rozwiązań

zad1: Uruchamiamy ./build/zad1server z argumentami ADRES i PORT. Jeśli uruchomimy z argumentami NULL NULL, serwer sam wybierze adres i port, które zostaną wyświetlone w terminalu. Następnie w kilku terminalach uruchamiamy ./build/zad1client ADRES PORT_SERWERA NAZWA. ADRES i PORT_SERWERA powinny być takie same jak w serwerze. Serwer zapamięta nazwy klientów. Komenda list zwróci klientowi na jego standardowe wyjście listę wszystkich aktywnych klientów (numer indeksu w tablicy i nazwa). Komenda 2all STRING wyśle do wszystkich klientów wiadomość STRING, 2one ID STRING wyśle do klienta o indeksie ID wiadomość STRING, STOP wyrejestruje klienta z serwera i zakończy jego działanie, ALIVE rozpocznie wysyłanie do klienta informacji o zarejestrowanych klientach, END_ALIVE zakończy wysyłanie tych wiadomości. Przykładowe działanie:

a) komenda LIST

```
urszula@Galadriela:~/semestr_4/SysOpy/lab11/StankiewiczUrszula-cw12$ ./build/zadlserver 10.1.0.167 3333
Server started on address: -1493171958
